

.NET CORE

Running C# inside of whatever, kinda...

A LITTLE ABOUT ME

- Andrew Denner
- Twitter: @adenner
- Web: <http://denner.co>
- These slides will be emailed out after tonight

QUICK REFRESHER ON .NET

- Microsoft's competitor to java
 - Managed memory (garbage collection)
 - JIT from MSIL code to machine code (compile once run on manyish)
 - Multiple languages supported and cross compatible. C# F# C++ Iron Python visual basic
- Originally started in late 90's Version 1 was released in Late 2000
- C# and the CLI are ISO ECMA standards (ISO-IEC 23271:2012 and ISO/IEC 23270:200)

Common Language Infrastructure

.NET compatible languages compile to a second platform-neutral language called Common Intermediate Language (CIL).

The platform-specific Common Language Runtime (CLR) compiles CIL to machine-readable code that can be executed on the current platform.

01001100101011
11010101100110

SO EASY

A CAVEMAN CAN DO IT

memegenerator.net

SCOPE

- Just to reassure everyone, we are just going to get things up and running in a simple hello world sort of way
- This will not be production configs, setting things up with a reverse proxy and security is out of scope
- Don't let this scare you off... as I said before, it is so easy that a code monkey could do it

THAT'S GREAT... BUT THIS IS THE LINUX USER'S GROUP

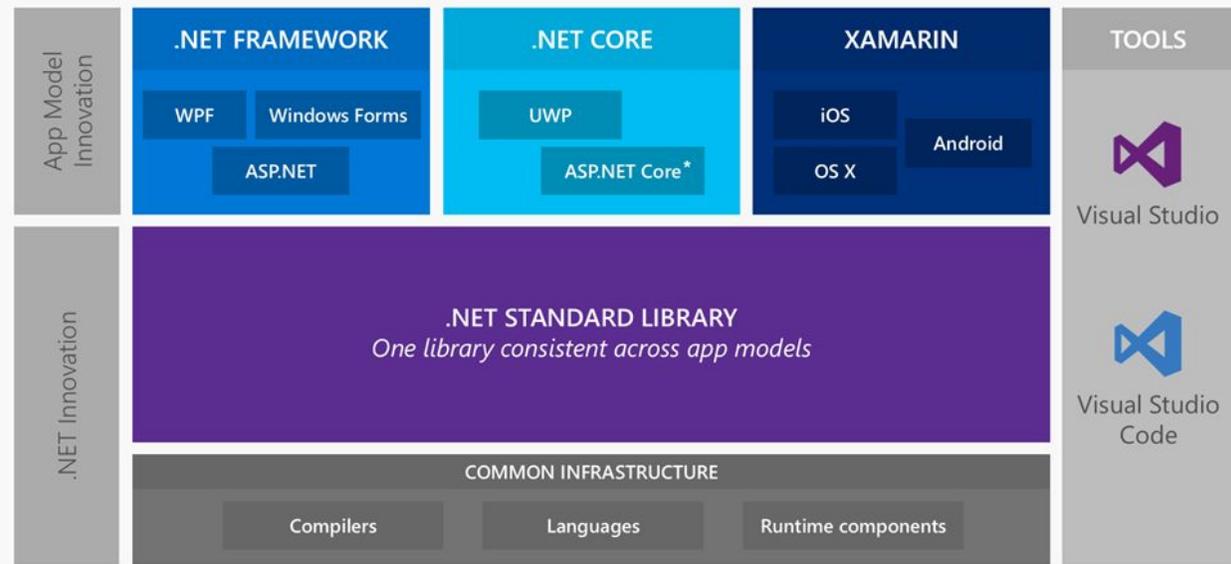

.NET ON LINUX?

- Even though it was a standard, it was only really on windows, there were also big parts of .net that were patent minefields ASP, Winforms, WPF etc.
- Along comes Mono...
 - Cross platform implementation of .net (Linux, Mac etc)
 - Was never as complete as the “real thing” i.e. no WPF
 - For most serious uses not free as in beer
 - Had an ok IDE, but not great, but due to binary compatibility could develop in windows using Visual Studio and run things in Linux without recompiling.
- Microsoft now has loved them enough that they bought them...

.NET CORE

- Modular development subset across all environments
- Open source and cross platform
- Does not cover everything

.NET future innovation

SO HOW CAN I TELL IF MY STUFF IS SUPPORTED?

- Visual studio extension or console application can check your IL (dlls)
- .net portability tool
<https://github.com/Microsoft/dotnet-apiport/releases>
- <https://docs.microsoft.com/en-us/dotnet/standard/portability-analyzer>
- ApiPort.exe analyze -f .
Looks at current directory

.NET Portability Report

Summary

Assembly Mono 4.5
HubApp1.Windows 94.84%

HubApp1.Windows

Missing assemblies
Windows, Version=255.255.255.255, Culture=neutral, PublicKeyToken=null

Target type	Mono 4.5	Recommended changes
Windows.Foundation.Rect	✘	
get_Width	✘	
get_Height	✘	

Error List

0 Errors 0 Warnings 25 Messages

Code	Description	Project	File
	System.Runtime.InteropServices.WindowsRuntime.WindowsRuntimeMarshal.AddEventHandler`1(System.Func`0[System.Runtime.InteropServices.WindowsRuntime.EventRegistrationToken],System.Action[System.Runtime.InteropServices.WindowsRuntime.EventRegistrationToken],`0) ... System.Runtime.InteropServices.WindowsRuntime.WindowsRuntimeMarshal.AddEventHandler`1(System.Func`0[System.Runtime.InteropServices.WindowsRuntime.EventRegistrationToken],System.Action[System.Runtime.InteropServices.WindowsRuntime.EventRegistrationToken],`0) Not supported on Mono 4.5	HubApp1.Windows	App.xaml.cs

HOW TO DO IT IN LINUX?

- VS code as an IDE, an easy install <https://code.visualstudio.com/>
- Console app “hello world”
 - Really easy...
<https://docs.microsoft.com/en-us/dotnet/core/tutorials/using-with-xplat-cli>
- Webserver
 - Also another Hello world
<https://docs.microsoft.com/en-us/aspnet/core/getting-started>
 - Recommended to place behind reverse proxy
<https://docs.microsoft.com/en-us/aspnet/core/publishing/linuxproduction>
- You can easily set up new projects using Yeoman
<https://docs.microsoft.com/en-us/aspnet/core/client-side/yeoman>

DEMO TIME!
